WPI; 2002-583321/62. N-PSDB; ABQ93399. New polynucleotide and polypeptides, useful for treatment and diagnosis of Alzheimer's, Parkinson's, Huntington's, amylotrophic lateral sclerosis, immune deficiencies, cancer, autoimmune disorders, multiple sclerosis, diabetes and allergies.

Claim 20; SEQ ID NO 357; 284pp + Sequence Listing; English.

The invention relates to an isolated polynucleotide (I) comprising one of 245 sequences (ABQ93288-ABQ93532). Treating a condition comprising administering to a mammalian subject a composition comprising the protein (II) encoded by (I) (ABP62809-ABP63053) or an antibody (III) to (II). (II) and (III) are useful for diagnostic evaluation of disorders (I) is useful for gene therapy of diseases and (II) can be used for

The invention relates to 592 new human secreted polypeptides useful for diagnosing, treating or preventing e.g. immune disorders, inflammatory conditions, respiratory disorders, cancers, CNS disorders, inflammatory conditions, respiratory disorders, cancers, CNS disorders, inflammatory can entrodegenerative disorders, or polypeptides comprising an amino acid sequence at least 95% identical to the new sequences. The polypeptides, acids encoding the polypeptides, against that bind to the polypeptides, nucleic acids encoding the polypeptides, against treating or preventing an e.g. immune could encoding the polypeptides, against treating or preventing an e.g. immune classoriers inflammatory conditions (e.g. inflammatory bowel disease, nephritis or Crohn's disease), respiratory disorders (e.g. asthma and allergy), cancers (e.g. gastric, ovarian or lung cancer). CNS disorders (e.g. multiple sclerosis or ischaemic brain injury), neurodegenerative disorders (e.g. Parkinson's disease or Alzheimer's disease), and cardiovascular disorders (e.g. atherosclerosis or myocarditis). The polymucleotides are useful for chromosome identification, chromosome mapping, for controlling gene expression through triple helix formation or antisense DNA or RNA, in gene therapy, for identifying individuals from minute biological samples, in forensic biology, and as hybridization or preventing neural disorders, indume system disorders, and for teating or preventing neural disorders, indume system disorders, and for treating or preventing neural disorders, indume system disorders, contactored corresponds to one of the polypeptide of the invention. Note: The sequence corresponds the part of format different sequences of the specification, but was obtained the minimal of the printed specification, but we obtained the minimal of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            NGVCQYRCRYGKAPMPRPGYKPQEPNGCGSYFLGLKVPESMDLGIPAMTKCCNQLDVCYD 120

2003-167512/16.

New human secreted polypeptides and polynucleotides, useful for diagnosing, treating or preventing e.g. immune disorders, inflammatory conditions, respiratory disorders, cancers, CNS disorders, or neurodegenerative disorders.

Claim 13; SEQ ID NO 1111; 1754pp; English.

The invention relates to 592 new human secreted polypeptides useful for diagnosing, treating or preventing e.g. immune disorders, inflammatory conditions, reapliatory disorders, cancers, CNS disorders, or conditions, respiratory disorders, cancers, CNS disorders, or neurodegenerative disorders, or polypeptides comprising an amino acid sequence at least 95% identical to the new sequences. The polypeptides, acids encoding the polypeptides, treating or preventing an e.g. immune of compositions for disease), treating or preventing an e.g. inflammatory conditions (e.g. inflammatory bowel disease, alergy), cancers (e.g. gastric, ovarian or lung cancer), constance of alergy), cancers (e.g. gastric, ovarian or lung cancer), constance of alergy, cancers (e.g. parkinson's disease or Alzheimer's disease), and cardiovascular disorders (e.g. atherosclerosis or mycoarditis). The cardiovascular disorders (e.g. atherosclerosis or mycoarditis). The polypeptides are useful for as molecular weight markers on corresponds. The polypeptides are useful for as molecular weight markers on correating or preventing neural disorders, immune system disorders, and for treating or preventing neural disorders, immune system disorders, cancerly proliferative and/or cancerous diseases. This sequence corresponds to one of the polypeptide of the invention. Note: The sequence data for this patent did form part of the printed specification, but was obtained in electronic format disorder.

Ruben SM; Rosen CA,

WPI; 2003-175238/17.

New human secreted proteins and nucleic acid molecules, useful for preparing a diagnostic or pharmaceutical composition for diagnosing, preventing or treating cancer or other hyperproliferative disorder, asthma, allergies or AIDS.

Claim 1; SEQ ID NO 1661; 3205pp; English.

The invention relates to novel genes ADA39629-ADA40565 and proteins ADA40566-ADA41501 for human secreted proteins, useful for preventing, treating or amedical conditions e.g. by protein or gene therapy. The polypeptides, nucleic acid molecules, antibodies or their fragments, and agonists or antagonists that bind to the polypeptide are useful for preparing a diagnostic or pharmaceutical composition for diagnosing or treating cancer or other hyperproliferative disorder. The polypeptides and nucleic acid molecules are also useful for detecting, preventing, diagnosing, prognosticating, treating or ameliorating cancer or other hyperproliferative disorders including neoplasms, autoimmune of sorders (e.g. diabetes, rheumatoid arthritis, systemic lupus erythematosus, multiple sclerosis, autoimmune thyroiditis or haemolytic anaemia), haematopoietic or haematological disorders (e.g. anaemia, inflammatory disorders (e.g. ischaemia-reperfusion injury, inflammatory bowel disease or Crohn's disease), neurodegenerative disorders (e.g. ischaemia-reperfusion at his case or parkinson's disease), cardiovascular disorders (e.g. atherosclerosis, myocarditis), inflammatory disorders (e.g. ischaemia-reperfusion diseases (bacterial, fungal or viral infections including HIV/AIDS), or wound healing and disorders of epithelial cell proliferation. The nucleic acids are also

The invention relates to novel genes ADA39629-ADA40565 and proteins ADA40566-ADA41501 for human secreted proteins, useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The polypeptides, nucleic acid molecules, antibodies or their fragments, and agonists or antagonists that bind to the polypeptide are disapparing a disappositic or pharmaceutical composition for cuseful for preparing a disappositic or pharmaceutical composition for disapposing or treating cancer or other hyperproliferative disorder. The polypeptides and nucleic acid molecules are also useful for detecting, contracting, disapposition, prognosticating, treating or ameliorating cancer or other hyperproliferative disorders including neoplasms, autoimmune curvices. Contracting, dispetes, rheumatoid arthritis, systemic lupus corrected disorders (e.g. diabetes, rheumatoid arthritis, systemic lupus curvicements, multiple sclerosis, autoimmune thyroiditis or haemolytic anaemia) haematopoietic or haematological disorders (e.g. anaemia, canaemia), haematopoietic reactions including asthma or eczem, thrombocytopenia), allergic reactions including asthma or eczem, canaemia, allergic reactions including asthma or eczem, conformatory disorders (e.g. atherosclerosis, myocarditis), infections disease), cardiovascular disorders (e.g. atherosclerosis, myocarditis), infections disease, or atherosclerosis, myocarditis), infection dispublished probes for differential identification cange restriction mapping, as molecular weight markers, or as the obtained in electronic format directly from WiPo at this patent did not form part directly from WiPo at this patent did not form part directly from WiPo at this patent did not form part directly from WiPo at the printed specification, but was obtained in electronic format directly from WiPo at

The invention describes a new isolated nucleic acid molecule comprising a sequence having at least 95% identity with a sequence comprising: (a) a polynucleocide (PN) fragment of a sequence comprising 420-3435 bp, or its albelic variant; (b) a PN fragment of the CDNA sequence; (c) a PN sequence encoding a polypeptide, or its fragment, domain, epicope or species homologue; or (d) a PN that hybridises under stringent conditions to any one of the sequences of (A)-(C). The nucleic acid is useful for preparing a medicant for preventing, treating or ameliorating a medical condition e.g., cancer, liver disorders such as hepatitis or neural disorders such as Alzheimer's disease. This is the amino acid sequence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acid molecule, useful for preparing a medicament for preventing, treating or ameliorating a medical condition e.g., cancer, liver disorders such as hepatitis or neural disorders such as Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 11; Page 357; 496pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      a novel human secreted protein

The present invention relates to novel human secreted proteins (ABR47633-ABR48145) and their coding sequences (ACC50344-ACC50856). The proteins and their coding sequences are useful for the preparation of a diagnostic or pharmaceutical composition for diagnosing or treating a cardiovascular disorder (e.g., arrhythmia, tachycardia, cardiac arrest, coronary arteriosclerosis and mycoardial isobaemia), neural disorders, immune system disorders, muscular disorders, reproductive disorders, immune system disorders and/or cancerous diseases and conditions, for wound healing and epithelial cell proliferation, to treat inflammation or infection, for treating thrombosis and arteriosclerosis, for treating thrombosis and arteriosclerosis, for treating conditions such as Alzheimer's disease and Parkinson's disease, to enhance bone and periodontal regeneration and aid in tissue transplants or bone graffs, to prevent skin aging or hair loss, to stimulate growth and differentiation of heematopoietic cells and bone marrow cells when used in combination with other cytokines, to maintain or graffs, to grays supporting cell culture of primary or organs before transplantation or for supporting cell culture of primary

The proteins and their coding sequences are useful for the preparation of a diagnostic or pharmaceutical composition for diagnosing or treating a cardiovascular disorder (e.g., arrhythmia, tachycardia, cardiac arrest, coronary arteriosclerosis and myocardial ischaemia), neural disorders, immune system disorders, muscular disorders, reproductive disorders, immune gastrointestinal disorders, publimonary disorders, renal disorders, proliferative disorders and/or cancerous diseases and conditions, for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     셤
                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents a secreted human protein encoded by the gene clone detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. AAX84924) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 125 novelones and their fragments (mucleic acid sequences: AAX84933-X85057; amino acid sequences AAX27667-Y27933) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypreptides in a sample or by determining the presence of mutations in the new polypurcleotides. Specific uses are described for each of the expressed in (see AAX84933 for described uses)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   180

                proteins. The DNA and protein sequences of the invention are useful as: markers for tissues in which the corresponding protein is preferentially expressed; as molecular weight markers on gels; as chromosome markers or tags; to identify chromosomes or to map related gene positions; and to compare with endogenous DNA sequences in patients to identify potential genetic disorders. The present amino acid sequence represents a protein

Isolated nucleic acids encoding TANGO polypeptides useful for preventing, diagnosing and treating diseases associated with inappropriate protein

Claim 9; Fig 2; 249pp; English

This invention describes novel human and murine nucleic acids encoding TANGO polypeptides (which are either wholly secreted or transmembrane proteins) which can be used for gene therapy and/or vaccination. The perceins which can be used for gene therapy and/or vaccination. The colfs may be used to produce TANGO 189 and TANGO 215. The nucleic acids may be used to produce TANGO 180 to TANGO 189 and TANGO 215 acids may be used to detect and quantify the presence of TANGO 189 and TANGO 215 acids in a sample and therefore identify or diagnose diseases associated with inappropriate TANGO expression (e.g. diseases related to over or under expression of the polypeptides or the expression of inactive polypeptides). The nucleic acids and the polypeptides they encode may be used according to standard gene therapy proteocols, to treat diseases associated with inappropriate TANGO expression by supplementing a sasociated with inappropriate TANGO expression by supplementing a continuous production of the polypeptide of to rectify mutations that the polypeptides may also be used to identify and produce agonists and also be used to identify and produce agonists and arrange and activity which may be used to an abnormally activite polypeptides are and arranged to an appropriate of the polypeptides which may be used to an advantage when the part are many and activity which may be used to an abordance when the part are many and activity which may be used to an abordance when the part are many and activity which may be used to a part and account the part and activity which may be used to a part and activity which may be used to a part and account and activity which may be used to a part and account and activity which may be used to a part and account and activity which may be used to a part and account and activity which may are accounted to the part and accounted the part a modulate TANGO related processes and diseases. The polypeptides are particularly useful for use as antigens for producing antibodise to TANGO proteins which may be used for inhibiting the activity of TANGO proteins. They may also be used to detect and quantify the presence of TANGO. proteins in samples and therefore identify patients in whom the protein is over- or under-expressed. This sequence represents the murine TANGO 180 protein described in the method of the invention

New group XII phospholipase A2 protein, useful for identifying modulators used for modulating prostaglandin production by Th2 cell and Th2 cell differentiation/activity, and treating allergy, cancer and type I diabetes.

Claim 17; Page 73-74; 77pp; English.

The invention relates to an isolated group XII phospholipase A2 (GXII PLA2) protein or its biologically active portion, where the protein or electrivaly Mydrolyses arachidonic acid in sn. 2 position of phosphatidylethanolamine. Methods of modulating Th2 cell differentiation activity by modulating either GXII PLA2 or GV PLA2 which is also preferentially expressed in T cells are provided. The GXII PLA2 encoding complete can detect to prepare anti-GXII PLA2 or GV PLA2 which is also can be used to prepare anti-GXII PLA2 or GV PLA2 which is play proteins concleic acid molecules can be used to prepare non-human transgenic concleic acid molecules can be used to prepare non-human transgenic concleic animals that contain cells carrying a transgene encoding GXII PLA2 encoding concleic animals that contain cells carrying a transgene encoding GXII PLA2 or protein. Prostaglandin production can be increased by stimulators of GXII PLA2 or GV PLA2 which is further concernation for that protein concernation is further concernation for the present of the graft and thus has applications in conceasing production of Th2-prometing cytokines for commercial purposes. Modulating the type of T helper cell response mounted in the individual response using GXII PLA2 or GV PLA2 inhibition of Th2 cell response using GXII PLA2 or GV PLA2 inhibitors is carried out for confiniting prostaglandin production to thereby inhibit production of Th2 associated cytokines in: (a) allergic parients to downregulate production of GV PLA2 stimulators is useful for treating autoimmune diseases associated cytokines in useful for treating autoimmune diseases associated cytokided are also useful in treating conditions such as type control or control or cytokided are also useful in treating conditions such as the methods provided are also useful in treating conditions such as the contradeptices in the methods provided are also useful in treating conditions and control or cont (mGXII-1 PLA2)

The peptides are designated TANGO 189 to TANGO 189 and TANGO 215. The nucleic acids may be used to produce TANGO 180 to TANGO 189 and TANGO 215 polypeptides according to standard recombinant DNA methodologies. They may also be used to detect and quantify the presence of TANGO nucleic acids in a sample and therefore indentify or diagnose diseases associated with inappropriate TANGO expression (e.g. diseases related to over or under expression of the polypeptides or the expression of inactive polypeptides). The nucleic acids and the polypeptides they encode may be used according to standard gene therapy protocols, to treat diseases associated with inappropriate TANGO expression by supplementing a

may result in expression of an abnormally active polypeptide. The polypeptides may also be used to identify and produce agonists and antagonists of TANGO expression and activity which may be used to modulate TANGO related processes and diseases. The polypeptides are particularly useful for use as antigens for producing antibodies to TANGO proteins which may be used for inhibiting the activity of TANGO proteins. They may also be used to detect and quantify the presence of TANGO proteins proteins in samples and therefore identify patients in whom the protein is over or under-expressed. This sequence represents the human TANGO 180 protein described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              65
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 inflammation, cardiovascular disease, anticancer, anti-inflammatory, antimicrobial, nootropic, neuroprotective, cardiovascular; hepatotropic, antiasthmatic; gene therapy, cell proliferation; neurological disorder; reproductive disorder; developmental disorder; arteriosclerosis; cirrhosis; psoriasis; acquired immune deficiency syndrome; anaemia; asthma; Crohn's disease; infection; Alzheimer's disease; schizophrenia; Parkinson's disease; Huntington's diseases; ovulatory defect;

human signal peptide-containing proteins HSPP-1 to HSPP-134. HSPPs have anticancer, anti-inflammatory, antimicrobial, nootropic, hepatotropic, neuroprotective, cardiovascular and antiaathmmatic activities, and can be used in gene therapy. HSPPs can be used to treat or prevent disorders associated with decreased activity or function of HSPP. Antegonists of HSPP are used to treat or prevent disorders associated with increased activity or function of HSPP. Such diseases include cell proliferation of HSPP are used to treat or prevent disorders associated with increased activity or function of HSPP. Such diseases include cell proliferation of including cancer), inflammation, cardiovascular, neurological, captrosis, psoriasis, acquired immune deficiency syndrome, anaemia, circhosis, psoriasis, acquired immune deficiency syndrome, anaemia, circhosis, psoriasis, acquired immune deficiency syndrome, anaemia, circhosal proceducion of HSPP (or diseases, schizophrenia, ovulatory defects, muscular dystrophy). HSPP conclete acids can be used for the recombinant production of HSPP, for detecting HSPP in standard hybridisation and amplification assays (for diseases and monitoring), in gene therapy, as antisense, triplex-forming cor ribozyme therapeutics, for detecting HSPP in standard hybridisation and amplification assays (for visitation and for chromesoms) and for chromesoms manning HSPP are also nead to reside variations, and for chromosomal mapping. HSPP are also used to raise specific antibodies (Ab) and to screen for agonists and antagonists fortential therapeutic agents). Ab are used to diagnose, or monitor, HSPP related diseases (in usual immunoassays), as therapeutic antagonists, in competitive drug screens, and for purification of HSPP from natural New human signal peptide-containing proteins useful in treatment, prevention and diagnosis of e.g. cancer, inflammation and cardiovascular Claim 1; Page 201; 327pp; English. disease.

AAE06607 standard; protein; 189 AA.

(first entry) 25-SEP-2001 AAE06607;

Human, hydrophobic domain, gene therapy, nutritional supplement, cell proliferation, immunomodulatory, autoimmune disorder; antimicrobial, multiple sclerosis, rheumatoid arthritis, insulin-dependent diabetes; Human protein having hydrophobic domain, HP10797.

haematopoiesis; tissue growth activity; Parkinson's disease; cytostatic; Huntington's disease; Alzheimer's disease; chemotactic; chemokinetic;

The present sequence is human protein with hydrophobic domain, HP10797.

The polynucleotide and polypeptide of the invention may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. The polynucleotides may be used to inappropriate polypeptide, by inserting the nucleic acids into a host cell produce the polypeptide, by inserting the nucleic acids into a host cell and culturing the cell to express the protein. The polynucleotides and cits complementary sequences may also be used as nutsigens in the production of antibodies and in assays to identify modulators of polypeptide expression and activity. The polypeptides and nucleic acids may be used as nutritional supplements, to madulate cultinate acids may be used as nutritional supplements, to madulate cutoimmune disorders such as multiple sclivity. The polypeptides and cutoimmune disorders such as multiple sclerosis, rheumatoid arthritis and autoimmune disorders such as multiple sclerosis, rheumatoid arthritis and cutoimmune disorders such as multiple sclerosis, theomatoid arthritis and insulin-dependent diabetes), to madulate haematopoiesis, to modulate activity (e.g. for the treatment of principon's disease, thurtington's disease and Alzheimer's disease), to modulate cativity to modulate chaemotatic and chemokinetic activity, to modulate haematopatic and child inflammation and to inhibit tumour growth Human proteins with hydrophobic domains and the nucleic acids encoding them, useful for preventing diagnosing and treating e.g. cancer, Alzheimer's and inflammation. 24. .189 /note= "Mature human protein with hydrophobic domain" haemostatic, thrombolytic; tumour growth inhibitor; anabolic; contraceptive; antiinfertility; antiinflammatory. 1. .23 /label= Signal_peptide 24. .189 Claim 1; Page 443-444; 563pp; English. Sequence 7, Application US/08485449
Patent No. 5824789
GENERAL INFORMATION:
APPLICANT: VANDENBERG, DAVID
TITLE OF INVENTION: HERMITOPOLETIC GROWTH FACTORS, NUCLEOTIDE
TITLE OF INVENTION: SEQUENCE ENCODING GROWTH FACTORS AND METHODS OF USE
TITLE OF INVENTION: THERDE
NUMBER OF SEQUENCES: 7
CORRESPONDENCE ADDRESS:
ADDRESSEE: MORRISON & POERSTER
Sequence 2, Application US/08485449
Patent No. 5824789
GENERAL INFORMATION:
APPLICANT: VANDENBERG, DAVID
TITLE OF INVENTION: BEQUIENCE ENCODING GROWTH FACTORS, NUCLECTIDE
TITLE OF INVENTION: THEREOF

"Expression of genes from Rahnella aquatilis that are necessary for mineral phosphate solubilization in Bscherichia coli.";
FERS Microbiol. Lett. 159:121-7(1998).
-! COFACTOR: Iron-sulfur cluster (Potential).
-! COFACTOR: Eron-sulfur cluster (Potential).
-! SIMILARITY: Belongs to the radical SAM superfamily. PqqE family.

-!- FUNCTION: Ca(2+)-dependent receptor for myeloid cells that binds to carbohydrates on neutrophils and monocytes. Mediates the interaction of activated endothelial cells or platelets with Leukocytes. The ligand recognized is sialy1-Lewis X.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- TISSUE SPECIFICITY: Expressed in all tissues examined: spleen, lung, brain, liver, heart, kidney, thymus and small intestine.
-!- INDUCTION: By acute inflammation (Probable).
-!- SIMILARITY: Contains 1 C-type lectin/LECAM family.
-!- SIMILARITY: Contains 1 GFP-like domain.
-!- SIMILARITY: Contains 8 Sushi (SCR) domains.

"Murine Wniloa and Wnilob: cloning and expression in developing
limbs, face and skin of embryos and in adults.";
Oncogene 13:1537-1544(1996).
-!- FUNCTION: Ligand for members of the frizzled family of seven
transmembrane receptors. Probable developmental protein. May be a
signaling molecule which affects the development of discrete
regions of tissues. Is likely to signal over only few cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isold=P48614-2; Sequence=VSP 006796;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       -!- SUBUNIT: Heterodimer of an alpha and a beta subunit. Beta-1 associates with aither alpha-1, alpha-2, alpha-1, alpha-4, alpha-4, alpha-1, alpha-9, alpha-10, alpha-10, alpha-9, alpha-10, alpha-10. Interacts with FLNA and FLNB (By similarity).
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- SIMILARITY: Belongs to the integrin beta chain family.
-!- SIMILARITY: Contains 2 VWFA-like domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      EMBL; 100/09; CAMAGO 186.1; -.

Yersinia enterocolitica is a urease beta-subunit.";
Infect. Immun. 61:2498-2504(1993).
-!- CATALYTIC ACTIVITY: Urea + H(2)0 = CO(2) + 2 NH(3).
-!- CATALYTIC ACTIVITY: Oxeel ions per subunit (By similarity).
-!- SUBUNIT: (Alpha, beta, gamma) (3) (By similarity).
-!- PTW: Lys=221 is carbamylated. The carbamoyl group provides the ligands for the two nickel ions (By similarity).
-!- SIMILARITY: Belongs to the urease family.
                                                                                                                                                                                                                                                                               STRAIN=A2635 / Serotype O:8;
